## BACKGROUND

- Impaired balance affects 75% of MS patients during the progression of the disease[1].
- Degradation in balance increases the risk of falls[2].
- Clinical balance rating scales (i.e. Berg Balance Test) often lack precision and depend on clinician's expertise.
- Force platform-based balance assessment is immobile and expensive.
- The BioStampRC<sup>®</sup> sensor is a soft, flexible wireless inertial sensor that can be attached to skin with minimal preparation.

**Objective:** Investigate the validity of BioStampRC<sup>®</sup> sensor to assess the balance performance of individuals with MS (with and without a history of falling) and healthy control subjects.

## METHODS

- Participants: 40 MS participants + 12 Healthy Controls

|                       | Healthy Control  | MS Non-Faller<br>(no falls in the past 6 month) | MS Recurrent Faller<br>(≥2 falls in the past 6 month) |
|-----------------------|------------------|-------------------------------------------------|-------------------------------------------------------|
| N (Male/Female)       | 12 (5/7)         | 23 (4/19)                                       | 17 (8/9)                                              |
| Age                   | 58.1 (36-73)     | 56.3 (29 - 68)                                  | 59.1 (48 -79)                                         |
| Years since diagnosis | NA               | 16.4 (1-37)                                     | 19.1 (5-35)                                           |
| EDSS median (range)   | NA               | 3.5 (0-6.5)                                     | 6 (3.5-7)                                             |
| ABC                   | 95.4 (92.5 -100) | 74.1(8.8 - 100)                                 | 59.9 (26.6 - 88.1)                                    |

• ABC – Activity Specific Balance Confidence Scale  
• EDSS – Self-reported Expanded Disability Status Scale

- The balance assessment consisted of two 30-second standing trials in three conditions:
  - Eyes Open/Firm Surface (EO)
  - Eyes Closed/Firm Surface (EC)
  - Eyes Open/Foam Surface (FEO)
- Postural sway was measured with a BioStampRC<sup>®</sup> sensor placed on the lower back (L5), as well as by a force plate placed under the feet.

| Measure abbreviation | Description                                     | Characterization |
|----------------------|-------------------------------------------------|------------------|
| JERK                 | Sway jerkiness, time derivative of acceleration | Sway smoothness  |
| CEA                  | 95% confidence sway ellipse area                | Sway amplitude   |
| SP                   | Total length of sway trajectory                 | Sway amplitude   |
| MV                   | Mean sway velocity                              | Sway velocity    |
| TP                   | Total power of sway                             | Sway power       |

## RESULTS

|     |                                                         | Force Plate    |                  |                     |    | BioStampRC <sup>®</sup> |               |                     |    |
|-----|---------------------------------------------------------|----------------|------------------|---------------------|----|-------------------------|---------------|---------------------|----|
|     |                                                         | HC             | MS Non-Faller    | MS Recurrent Faller |    | HC                      | MS Non-Faller | MS Recurrent Faller |    |

Mean and SE of sway measurements by BioStampRC<sup>®</sup> and force plate. \* significant difference between HC and MS Recurrent Faller, + significant difference between HC and MS Non-Faller (p<0.017).

- CEA and TP sway metrics (derived from force plate and BioStampRC<sup>®</sup>) can differentiate MS Recurrent Faller from HC in all test conditions.
- Force plate based metrics (CEA,SP,MV, TP) and SP metric from BioStampRC<sup>®</sup> can additionally differentiate MS Non-Faller from HC in EC condition.
- Sway JERK, a unique metric for accelerometry measure, can differentiate MS Recurrent Faller from HC in EC/FEO conditions.

| Spearman Rho | EO   | EC   | FEO  |
|--------------|------|------|------|
| CEA          | 0.88 | 0.89 | 0.88 |
| SP           | 0.90 | 0.95 | 0.87 |
| MV           | 0.66 | 0.74 | 0.80 |
| TP           | 0.87 | 0.94 | 0.88 |

- Moderate to strong correlation (rho >0.66) between BioStampRC<sup>®</sup> and force plate based sway metrics.

| AUC  | Force Plate | BioStampRC <sup>®</sup> |
|------|-------------|-------------------------|
| JERK | NA          | 0.648                   |
| CEA  | 0.660       | 0.630                   |
| SP   | 0.653       | 0.648                   |
| MV   | 0.653       | 0.630                   |
| TP   | 0.666       | 0.660                   |

- BioStampRC<sup>®</sup> based sway metrics were as effective for differentiating individuals with poor balance as the force plate sway metrics.

## DISCUSSION

- The BioStampRC<sup>®</sup> sensor is a valid and objective measurement tool for postural sway assessment.
- MS recurrent faller swayed more than healthy controls, and their postural sway increased more than those in controls with altered sensory conditions.
- This soft, flexible wireless inertial sensor offers a portable and easy-to-administer balance assessment, and provide key information on individual's falls risk.
- Future work is needed to examine whether body motion quantified by this skin-mounted inertial sensor are predictive of falls.
